Sexual reproduction → genetic variation

- This talk is not about the evidence for sexual reproduction of *P. infestans* in Sweden
- Builds on previous work done to examine questions about
 - Inoculum sources (tubers or external)
 - Possible selection processes from reduced fungicide doses
 - Relationships between geographically separated samples of *P. infestans* from within Sweden
- Important tools needed for this work—microsatellite markers and relevant computer programs

Reducerade fungiciddoser vid bekämpning av potatisbladmögel

– Vilka blir följderna?

Reduced doses of fungicide for the control of potato late
blight

– What are the consequences?

Magnus Jönsson och Gabriella Olsson

Genotypic and phenotypic variation of *Phytophthora infestans* on potato in the two Swedish regions Bjäre and Östergötland in 2015

Ida Petersson

Analyses done with

POPPR
Population Genetics in R

1

Migrate-n

Poppr functions used:

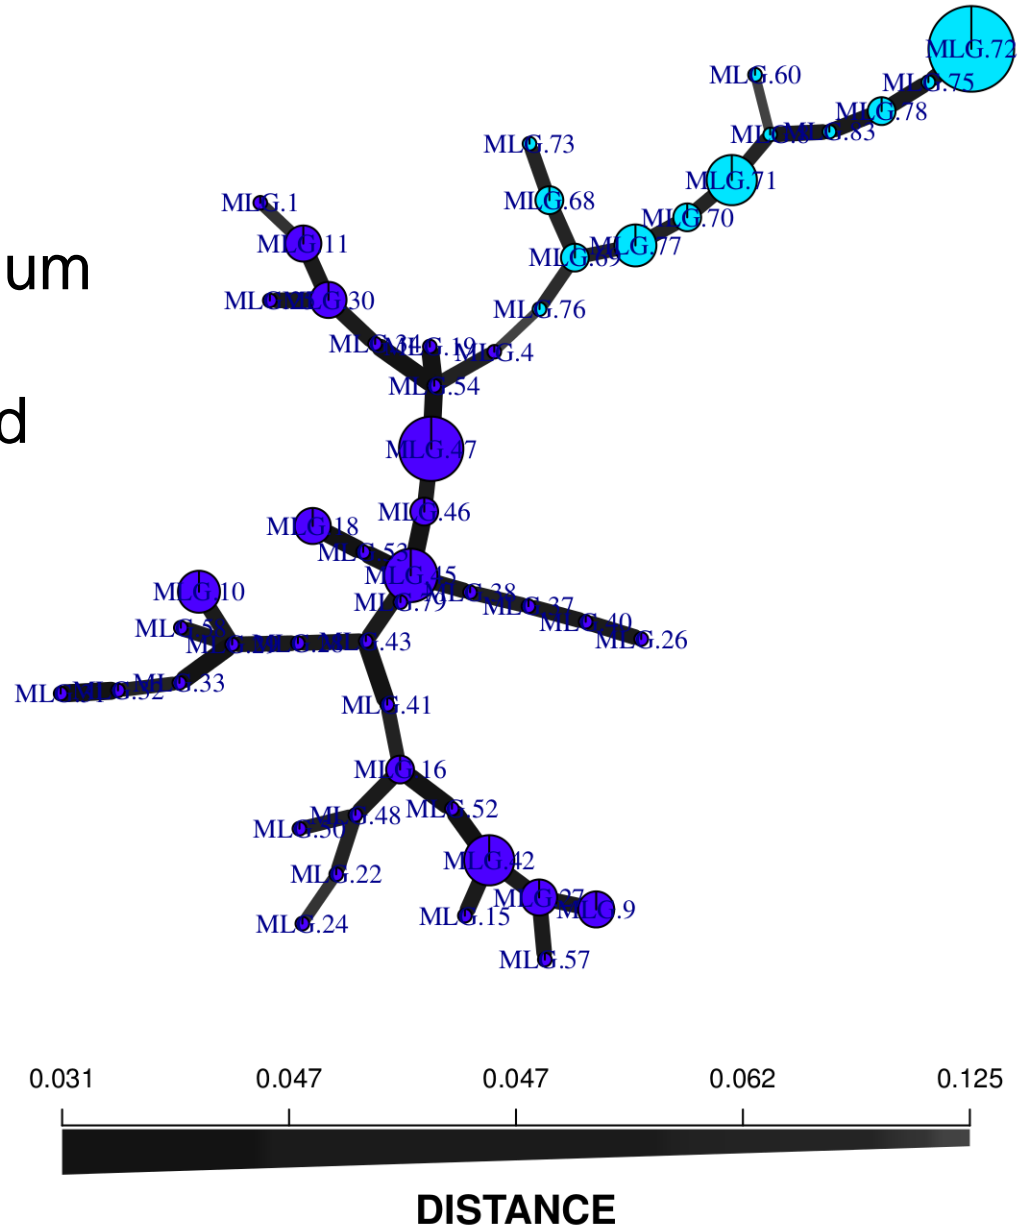

- Bruvo distance: includes information about the difference in the number of repeats. Larger difference in number of repeats – bigger difference.
- Minimum spanning networks. Size of circle indicates number of individuals with that genotype, thickness of line represents how closely related they are.

POPULATION

- pot_us1
- pot_ke1

Potato-Uganda

Example of a minimum spanning network comparing US-1 and KE-1 from Uganda

Inoculum sources?

- The tuber infection experiment and the selection processes/reduced dosages experiment had multiple samplings during the course of the late blight epidemic.
- Genotypes that were in the infected seed tubers did not contribute significantly to the resulting epidemic
- Reduced fungicide dosages did not cause any selection in the population present in that experiment.
- Multiple time points enable a comparison of genotypes during the epidemics
- 221 samples used in the following analyses

plot by date

Look at time of sampling

Most clones appear at only one sampling time, though some appeared more than once.

Reducerade fungiciddoser vid bekämpning av potatisbladmögel

– Vilka blir följderna?

Reduced doses of fungicide for the control of potato late
blight

– What are the consequences?

Magnus Jönsson och Gabriella Olsson

- Study had different fungicides and doses
- 3 sampling time points
- 170 samples after editing and removing individuals with too many missing values

Where does inoculum come from?

- External sources (from outside the field) are the primary source of inoculum.
- Those clones that invade a field at the beginning are not necessarily those that dominate at the end.
- Control of inoculum sources from outside any particular field can be extremely important for that field (regional control strategies?)
- Population seems to be stratified in time but we have no biological data that indicates why some clones appear earlier than others.

**Genotypic and phenotypic variation
of *Phytophthora infestans* on potato
in the two Swedish regions Bjäre and
Östergötland in 2015**

Search Google Maps

The map displays the geographical region of Scandinavia, specifically Sweden and Denmark. Major Swedish cities such as Stockholm, Göteborg, and Malmö are visible, along with Danish cities like Copenhagen and Århus. The Baltic Sea is to the east, and the North Sea is to the west. The map includes a search bar at the top left, a navigation and zoom control panel at the bottom right, and a small inset map of Europe at the bottom left. The Google logo is centered at the bottom of the map area.

Can we estimate migration?

POPP_R
Population Genetics in R

```
D:\shared\r\poppr\lb_sweden\genclone2migrate.R - R Editor
genind2migrate <- function(gid, filename="migrate.txt", repMotif=repeats)
{
# convert to a data frame
df <- genind2df(gid, sep=".", usepop=TRUE)

# if both alleles are missing
df[is.na(df)] <- "?.?"

# if one is missing it is missed so we fix
df2 <- as.data.frame(sapply(df, gsub, pattern="NA", replacement="?"))

pop_names <- levels(gid@pop)
pop_n <- length(pop_names)
```

- Use Bayesian inference within migrate-n to estimate population size and migration rates with different models
- Use Bayes's Factor to compare different models.

Somewhat computation intensive...

MIGRATION RATE AND POPULATION SIZE ESTIMATION
using the coalescent and maximum likelihood or Bayesian inference
Migrate-n version 3.5.1 []
Compiled for a PARALLEL COMPUTER ARCHITECTURE
One master and 6 compute nodes are available.
Program started at Sat Jul 9 08:59:36 2016
Program finished at Sat Jul 9 18:22:36 2016

Run for a 4 parameter model (2 population sizes and 2 migration rates)

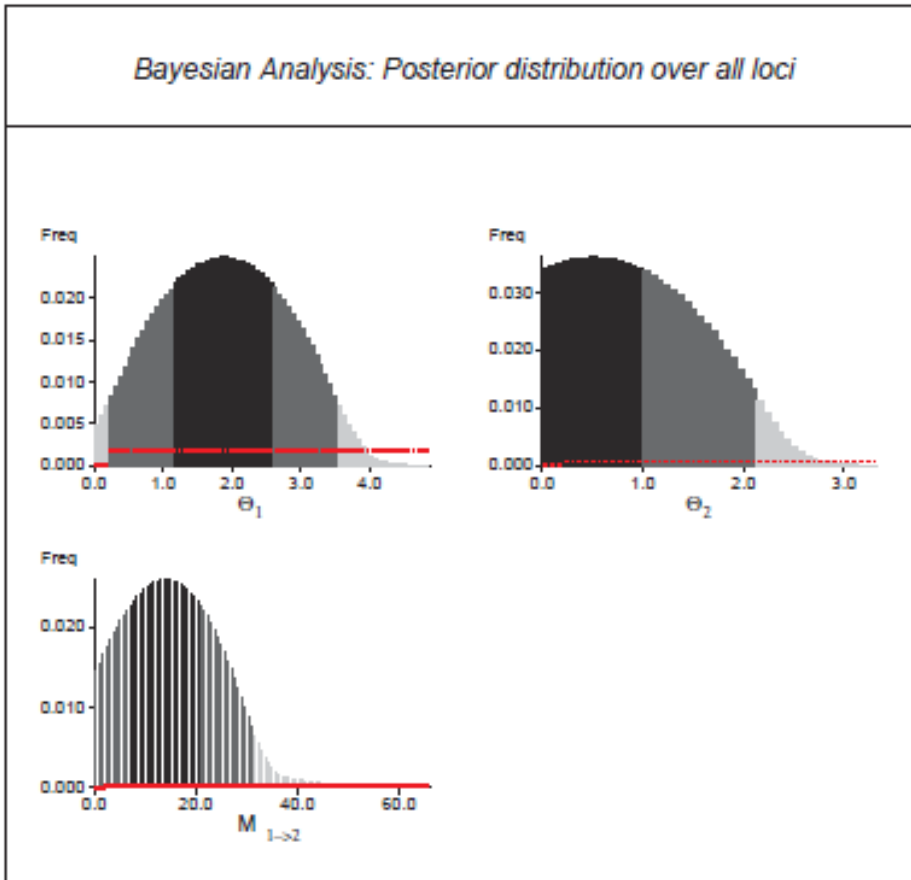

Comparison with Bayes's Factor

Model	Marginal Likelihoods				Average
	Run 1	Run 2	Run 3	Run 4	
1 single population	-1341.36	-1291.8	-1333.39	-1312.27	-1319.705
2 populations, 2-way migration	-1316.6	-1407.32	-1352.26	-1321.58	-1349.44
2 populations, Bjäre to Östergötland only	-1178.38	-1188.34	-1179.57	-1179.64	-1181.4825
2 populations, Östergötland to Bjäre only	-1169.57	-1209.05	-1201.77	-1199.04	-1194.8575

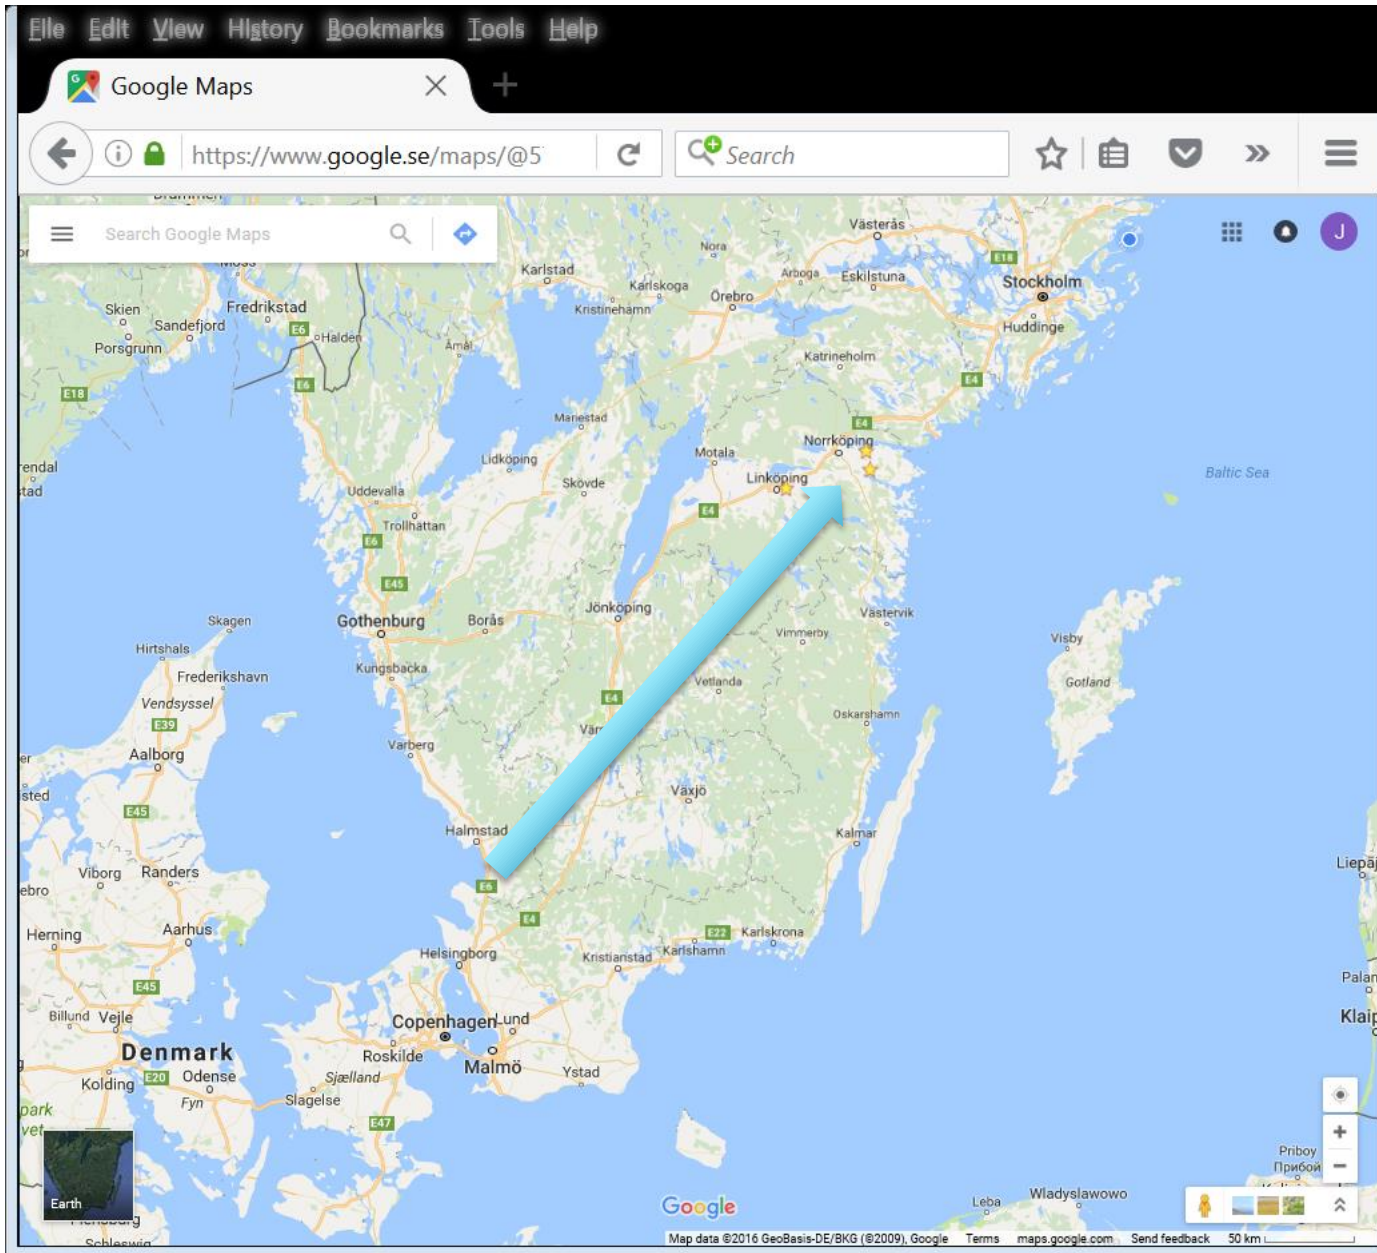

Larger value Marginal Likelihood → better model. Best model here is 2 populations with migration only from Bjäre to Östergötland

Estimates of population sizes and migration

name of the data set -- 15

Bjäre population is larger than the one in Östergötland

The image shows a screenshot of a web browser displaying Google Maps. The browser's address bar shows the URL <https://www.google.se/maps/@5>. The map itself is centered on Sweden, with a prominent red arrow pointing to the city of Norrköping. Other cities visible on the map include Stockholm, Gothenburg, Jönköping, and Malmö. The map interface includes a search bar at the top left, a search icon, and a user profile icon 'J' at the top right. At the bottom, there is a Google logo, a scale bar for 50 km, and a copyright notice: "Map data ©2016 GeoBasis-DE/BKG (©2009), Google Terms maps.google.com Send feedback".

Exploit genetic variation to understand late blight epidemiology

- We can use the variation to study temporal stratification in *P. infestans*.
- Different clones appear at different times but many do not seem to persist
- Most new infections come from sources external to the field
- Spatial variation also exists in *P. infestans* in Sweden. Local populations exist and migration (genetic exchange) between these populations can be estimated.
- *P. infestans* likes to move around but apparently not too far all at once.....
